

ABSTRACT OF THE DISCLOSURE

[0097] Adware and viruses are examples of objects that may be embedded in a web page or linked to a web page. When such an object is detected to be associated with a web page loading on a browser, an analysis may be performed to determine a trust level for the object. The object is suppressed based on the trust level. A prompt is displayed to advise a user that the object has been suppressed, and to provide an opportunity to interactively accept or decline activation of an action for the object.
